

# Satellite Irrigation Management Support with the Terrestrial Observation and Prediction System

**Forrest Melton**

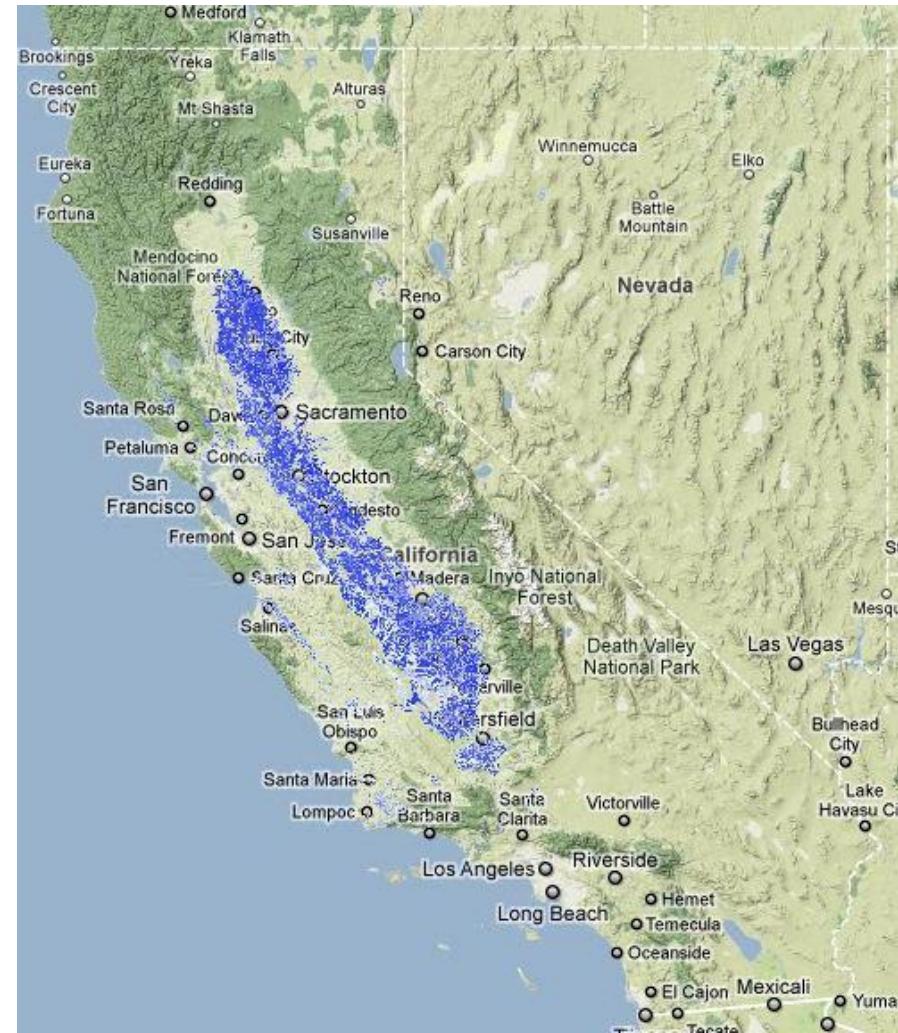

forrest.s.melton@nasa.gov

## Project Team:

Ecological Forecasting Lab  
CSU Monterey Bay & NASA ARC, Moffett Field, CA

## Partners:

California Department of Water Resources  
Western Growers Association  
Center for Irrigation Technology, CSU Fresno  
USDA Agricultural Research Service / NRCS  
Univ. of California, Cooperative Extension  
USGS  
Booth Ranches  
Chiquita  
Constellation Wines  
Del Monte Produce  
Farming D  
Fresh Express  
Periera Farms  
Ryan Palm Farms  
Tanimura & Antle

*Support for this project provided by the NASA Applied Sciences Program, CSU Agricultural Research Initiative, CDFA*

# California Agriculture

- Significant ag production, \$38.5B in cash farm receipts in 2010 from 81,700 farms
- Major domestic/international supplier of specialty crops
- Half of US-grown fruits, nuts, vegetables
- Diversity of crops

Source: Calif. Dept. Food & Agriculture

# Motivation: Benefits of Using Ag Weather Information in Irrigation Management

- Irrigation uses ~80% of water in CA
- During droughts, critical to optimize irrigation use
- California Department of Water Resources and UC Berkeley surveyed growers in 1990s
- Growers who utilized weather and  $ET_o$  data reported an increase in yields of 8% and a decrease in applied irrigation of 13% (DWR, 1997)
- Use of ET data in irrigation scheduling still not widespread; majority of growers rely on the condition of the crop and the feel of the soil as primary guides in scheduling irrigation

**Method Used by Farmers to Decide When to Irrigate, USDA Farm & Ranch Irrig. Survey, 2008**

<b>Method</b>	<b>Percent of Farmers</b>	
	CA	US
Condition of Crop	66%	78%
Feel of soil	45%	43%
Personal calendar schedule	32%	25%
Soil moisture sensing device	14%	9%
<b>Daily ET reports</b>	<b>12%</b>	<b>9%</b>
Scheduled by water delivery org.	11%	12%
Commercial or government scheduling service	10%	8%
When neighbors irrigate	6%	7%
Other	6%	9%
Plant moisture sensing device	3%	5%

*Growers may report more than one method, so total of all methods may exceed 100%.*

# California Irrigation Management Information System

- Standard approach for incorporating weather information into irrigation management practices

$$ET_c = ET_o * K_c$$

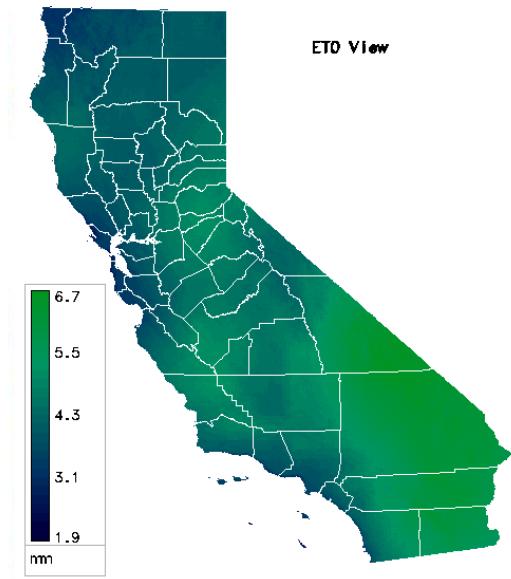

↗

CIMIS, AgriMet, AZMET, CoAgMet

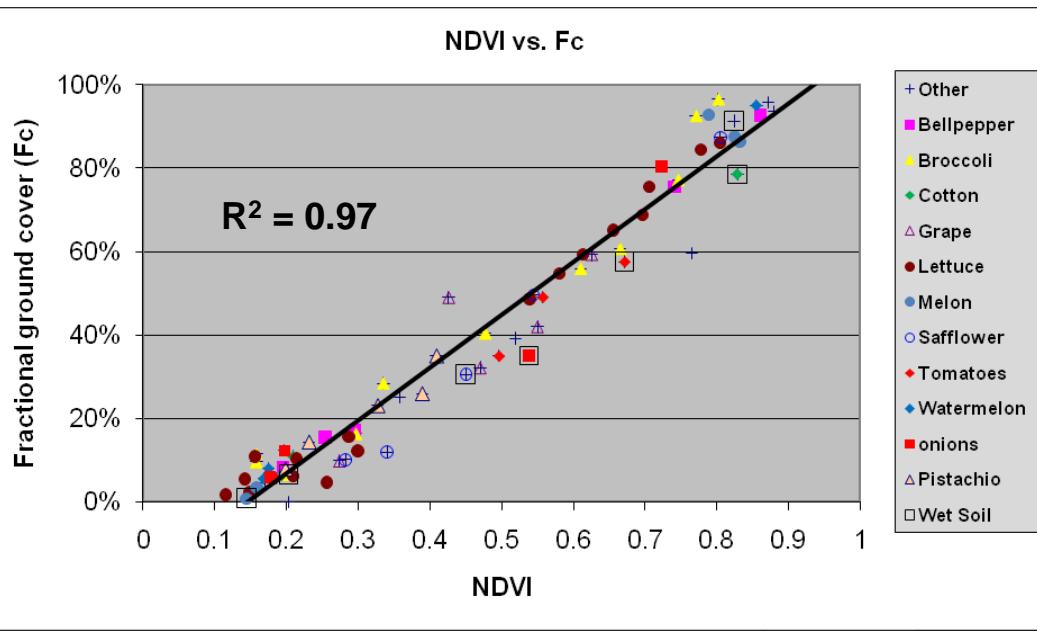

Photo credit: DWR CIMIS

- California Irrigation Management Information System (CIMIS)
  - Operated by CA DWR since 1982
  - More than 139 stations currently providing daily measurements of  $ET_o$
  - **Spatial CIMIS** data now available for CA; 2km statewide grid, daily

Spatial CIMIS  $ET_o$  16 Sept 2010

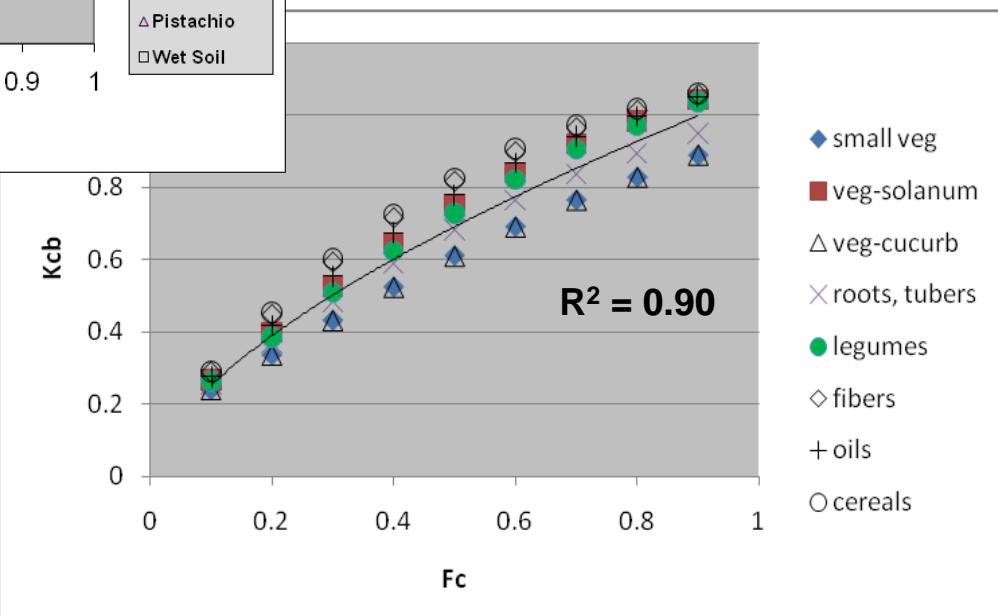

# Approach: Mapping Crop Coefficients and Indicators of Crop Water Requirements from Satellite Data

Trout et al., 2008; Johnson & Trout, 2011

Recent studies by Allen & Pereira (2009) and others provide basis for linking fractional cover to  $K_{cb}$  for a range of crops. Additional studies ongoing in collaboration with CSU Fresno and UC West Side Research & Extension Center

USDA studies provide basis for linking satellite vegetation indices (NDVI) to fractional cover.

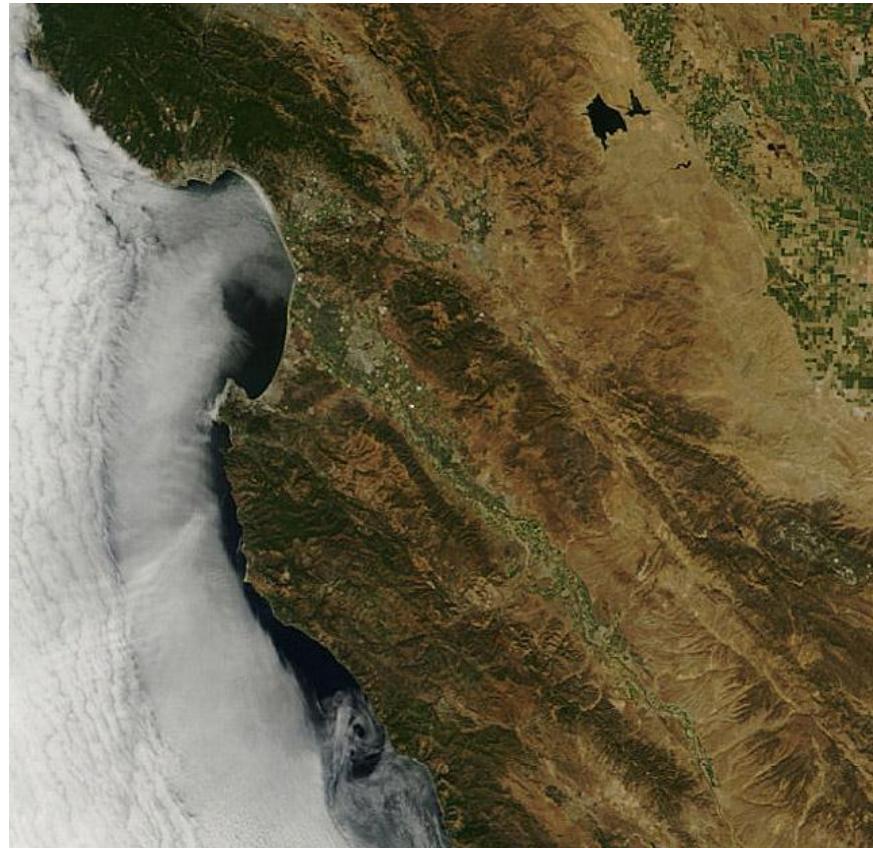

Also see Bryla et al., 2010; Grattan et al., 1998; Hanson & May, 2006; Lopez-Urrea et al., 2009

# Satellite Data

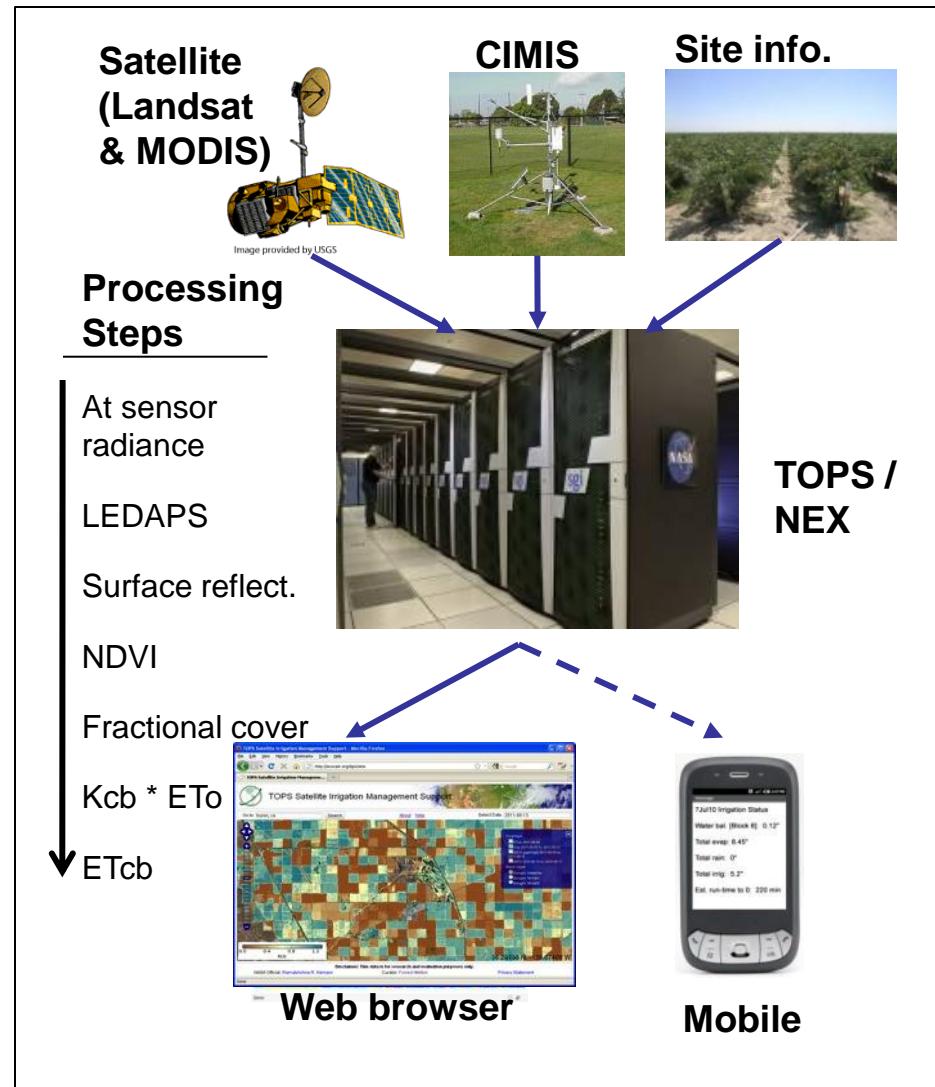

Landsat 5 and 7 (TM / ETM+)  
(30m / 0.25 acres)

Terra / Aqua (MODIS)  
(250m / 15.5 acres)

# Objectives

1. Develop near real-time information products from satellite data to support growers in optimizing irrigation:  $F_c$ ,  $K_{cb}$ ,  $ET_{cb}$  maps at field scale
2. Build data processing systems required to combine data from satellites and surface observation networks in real-time to map crop coefficients and crop water requirements
3. Integrate new capability into CA DWR CIMIS framework
4. Grower outreach and education in partnerships with Western Growers and other grower organizations

# Customized Reporting: Field Level Summaries

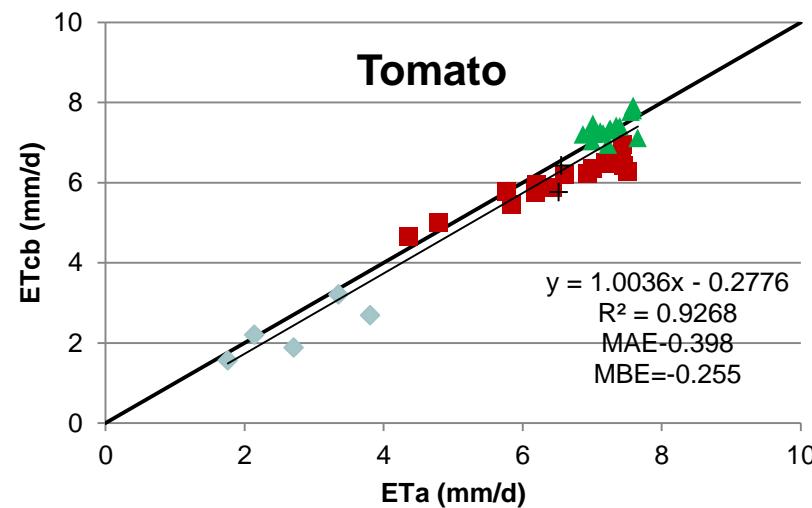

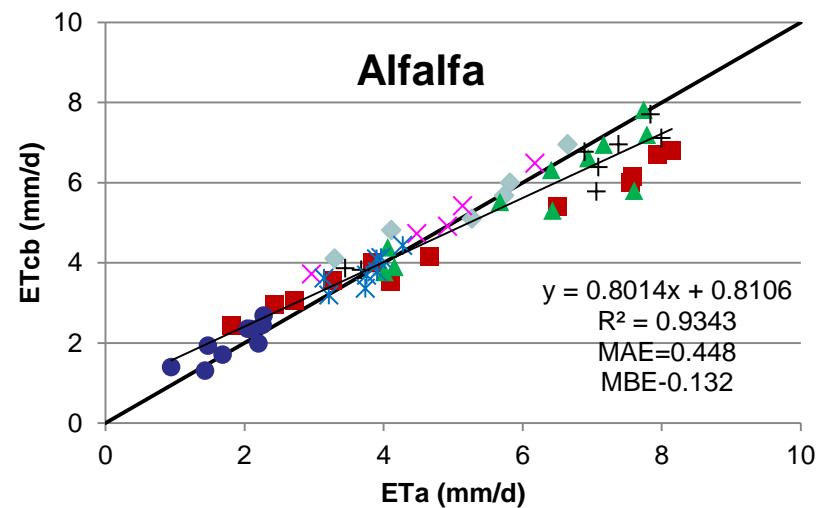

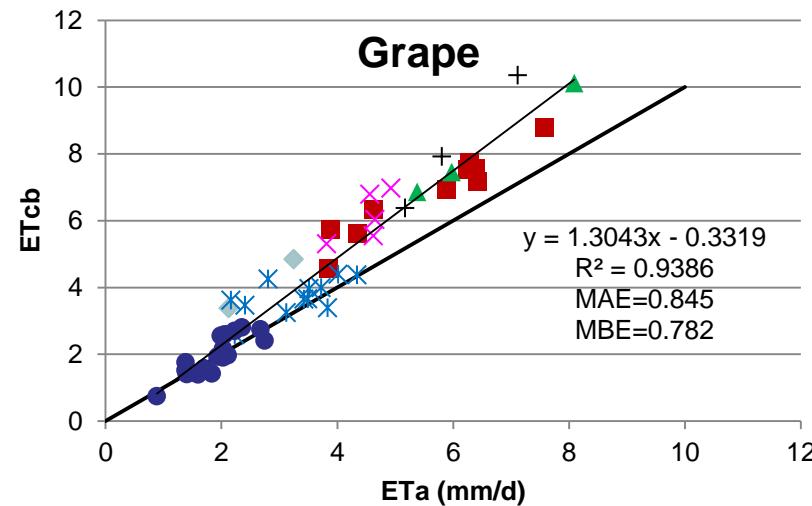

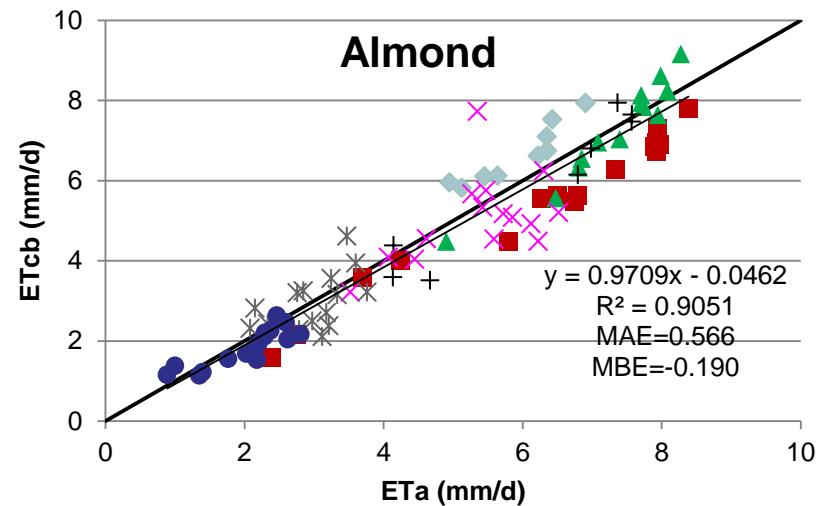

# Approach: System Validation and Accuracy Assessment

- Comparison with standard practices and other previously validated models
- Comparison against measurements from soil moisture sensor networks installed in collaboration with partner growers
- Comparison against measurements of evapotranspiration on commercial farms

# Satellite ET Mapping

## TOPS SIMS (Automated) vs SEBAL (Manual)

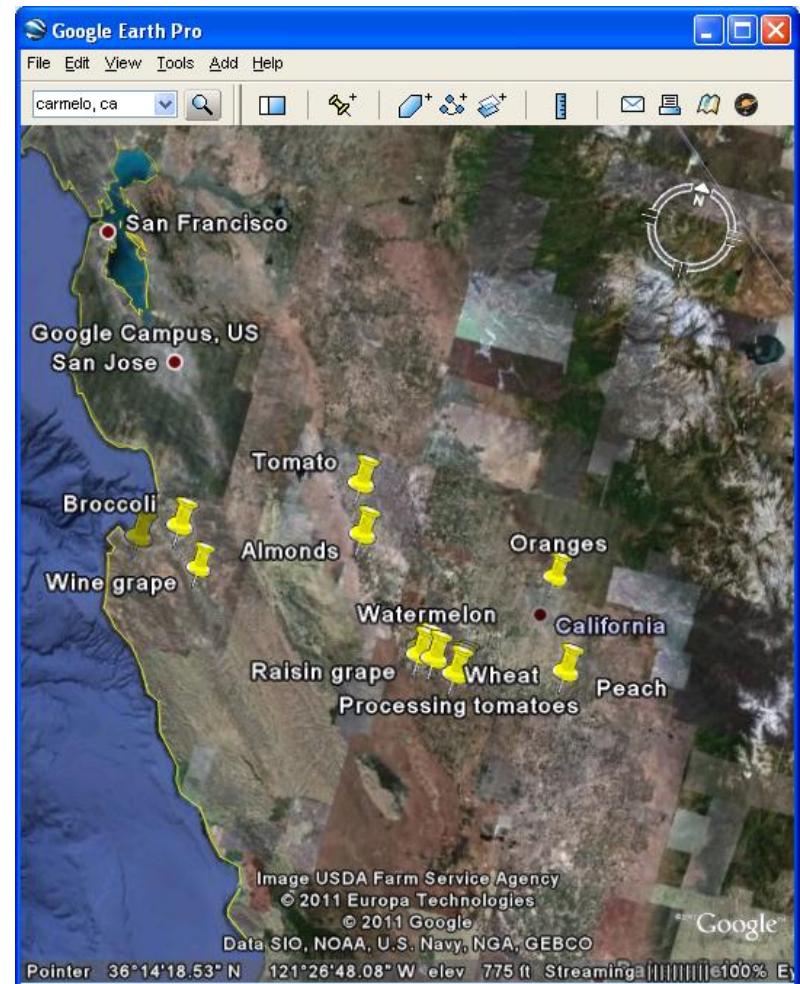

# SIMS: Field Sensor Network Components

- 1) Surface renewal instrumentation for measuring ET
- 2) Volumetric water content at 8-12 points at four depths (10HS)
- 3) Soil water potential at 8 points at one depth (MPS-1)
- 4) Deep drainage at two points (Gee passive capillary lysimeter)
- 5) Flow measurements at two irrigation standpipes (Badger)
- 6) Meteorological data (RH, T, P, wind speed, solar radiation)

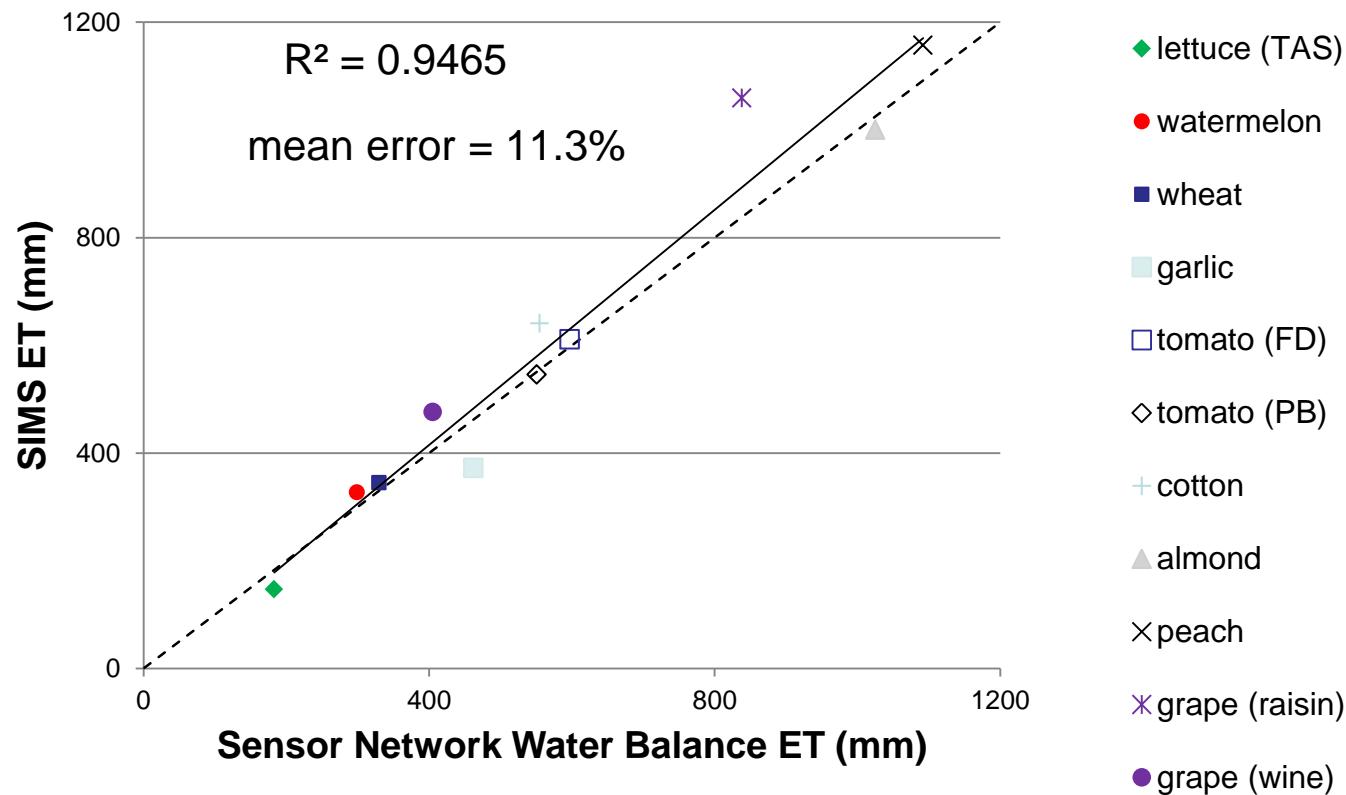

# Sensor Network Installations

Crop Type	Crop	Location
Grain	Corn*	CSU Fresno
Grain	Wheat	San Joaquin Valley
Row	Garlic	San Joaquin Valley
Row	Lettuce*	SJ & Salinas Valley
Row	Broccoli	Salinas Valley
Row	Cauliflower	San Joaquin Valley
Row	Tomato(2)*	San Joaquin Valley
Row	Cotton (drip)*	San Joaquin Valley
Vine	Melon	San Joaquin Valley
Vine	Wine grapes*	Salinas Valley
Vine	Raisins*	San Joaquin Valley
Tree	Peach*	San Joaquin Valley
Tree	Almond*	San Joaquin Valley
Tree	Orange*	San Joaquin Valley

\*Surface renewal instrumentation.

# SIMS Verification Results (2011)

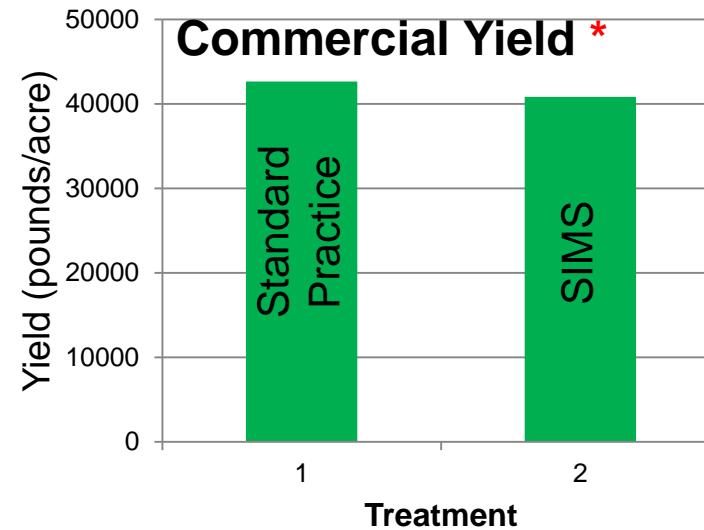

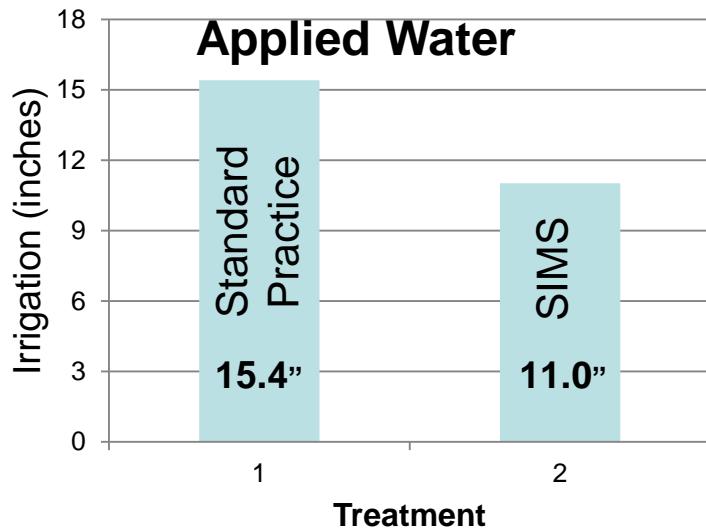

# Impacts: Benefits of Using Ag Weather Information in Irrigation Management

## Specialty Crop Irrigation Trials

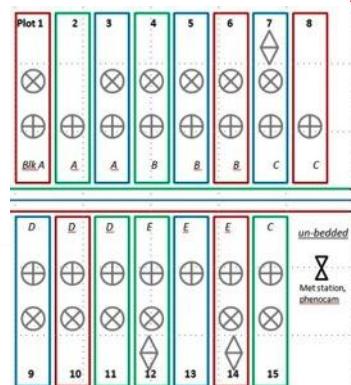

Research Partners: CSUMB/NASA, USDA-Ag Research Service, UC Cooperative Extension

Commercial Cooperators: Chiquita/Fresh Express, Inc., Tanimura & Antle, Inc.

Sponsor: Calif. Dept. Food & Agriculture

\*no significant difference in yields despite 28.6% less applied water

# Quantifying Benefits of Using Ag Weather Information in Irrigation Management

Water, Yield and Total Benefits to Farmers from CIMIS				
Crop	Water \$US +	Yield++ \$US	Total \$US	Benefit/Hectare \$US
Trees and Vines Sample				
Almonds	246,000	2,426,500	2,672,500	408
Apples	900	13,900	14,800	366
Avocados	-141,350*	738,000	596,500	760
Grapes	100,850	1,336,500	1,437,3500	730
Pistachios	370,150	6,755,000	7,125,000	630
Plums	556	12,445	13,000	402
Vegetable Sample				
Artichoke	2,500	326,200	328,700	160
Broccoli	2,750	106,100	108,850	730
Cauliflower	5,750	334,100	339,850	870
Celery	3,350	345,750	349,100	1700
Lettuce	26,000	1,361,000	1,387,000	920
Field Crop Sample				
Alfalfa	47,790	325,700	373,500	100
Cotton	345,300	810,500	1,155,800	110

Source: <http://www.cimis.water.ca.gov/cimis/resourceArticleOthersTechRole.jsp>

+Money saved due to reduced water bill resulting from using CIMIS.

++Increased income from increased yield resulting from using CIMIS.

\*Negative number indicates increased water use with CIMIS.

Average reduction in total applied water: 13%

Average increase in yields: 8%

**Benefit of ≥ \$100/ha:  
Increasing use of ET  
from 12% to 22% has  
value of ~\$60m/yr**

# Next Steps (FY13)

- **Integration of data from SPOT and Landsat Data Continuity Mission**
- **Complete analysis of additional surface renewal data collected by CA DWR + 2012 data**
- **Completion of field-level reporting tools and integration with mobile-optimized interface**
- **Developing plans for formal system verification with CA DWR**
- **Initiation of operational trials with partner growers**
- **Finalize plans for outreach and education program with Western Growers and NRCS**
- **Integration of satellite-driven energy balance models in collaboration with Desert Research Institute**

A photograph of a vast almond orchard in full bloom. The trees are densely packed and covered in white flowers. In the foreground, a person wearing a blue jacket and dark pants is kneeling on the ground, working with some equipment. There are several red buckets and pipes scattered around them. A small orange flag is planted in the ground nearby. The ground is covered in fallen flower petals.

# Questions?

# Back-up Slides

# Summary

- **Information on evapotranspiration (ET) can be used to support optimization of irrigation and nutrient management**
- **SIMS: Application of NASA satellite and computing technologies to develop new information products to support U.S. growers working to maximize the benefit of available water supplies**
- **Prototype system developed for California and currently being tested in collaboration with partner growers in 2012**
- **System validation on-going, initial results are highly encouraging**
- **Partnerships with CA DWR, Western Growers Association, USDA ARS, and individual growers / irrigation consultants in the California Central Valley and Salinas Valley are key to project success**

# Water Resource Management Challenges

- Drought impacts
- Competing demands
- Water quality and impaired water bodies
- Aging water conveyance infrastructure
- Groundwater overdraft
- Population growth and climate change
